

# DREAMWEAVER

*Natick High Web Design*

CSS3

Adobe Dreamweaver is primarily a HTML and CSS editor program but can also be used for other languages.

## DREAMWEAVER FEATURES

- Create compelling website for more platforms and devices.
- Manage your files from within the files panel.
- Building the Web one site at a time.
- Collaborate with co-workers within Dreamweaver
- Spice up your site with sprys and library items.
- Publish your files to the Web in seconds!
- Learn the latest and greatest with Adobe Dreamweaver through watching tutorials on Adobe TV
- Connect to Photoshop from within Dreamweaver to edit the photos on your site.
- Run site reports in a matter of seconds. HTML tags and broken links can be fixed with the aid of DW.
- Work with divs to place your elements in layers.

# Misc. Before You Begin

## Section 1

### • Site Folder Structure

Folder structure is very important when creating a Website. Create an organized folder structure locally so that when you publish your files they can be easily found remotely. A suggested organization system is recommended below. The structure below is suggested if you are using internal CSS. If you use external CSS it is recommended you set up a css folder which you place any .css files.

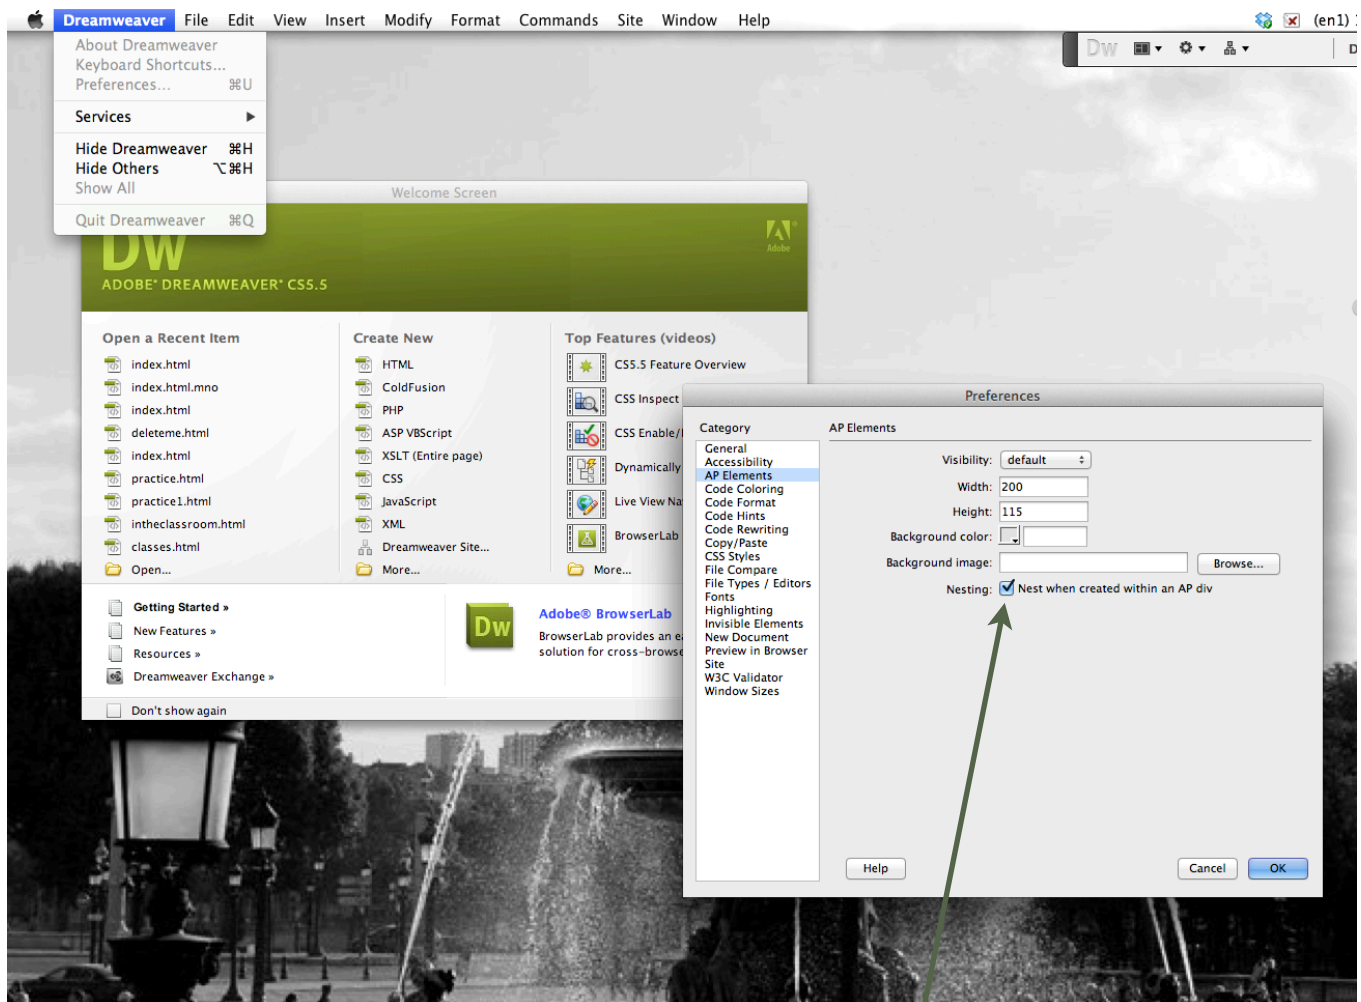

- All the folders and files are located in the root folder.
- Inside the root folder (on level 1) you save all .html files which will be linked on your site
- Inside the root folder are two folders: images and sources
- Inside the images folder: you save all the images which you will place on your site
- Inside the sources folder: you save all the files which will not be placed on the actual site but are used as references (example: site map, wire frame, .psd files)

# Misc. Before You Begin

## Section 1

### • Dreamweaver Preferences

Before starting to build any page or site in Dreamweaver you want to check the pre-set Dreamweaver preferences. To check these settings click on Dreamweaver --> Preferences.

- Top priority preference: go to the AP Elements tabs on the left hand side. In that preference make sure “Nest when created within an AP div” is checked on. This preference will allow AP divs be placed within the container div.
- Your choice preference: One preference I like to change is the Font --> Code View. Changing this preference will increase the font size of the text in code view.

# Misc. Before You Begin

## Section 1

### • Understanding Page Breakdown

Think of a setting up a Web page as setting up a stage with actors. You can find the comparison to the two below.

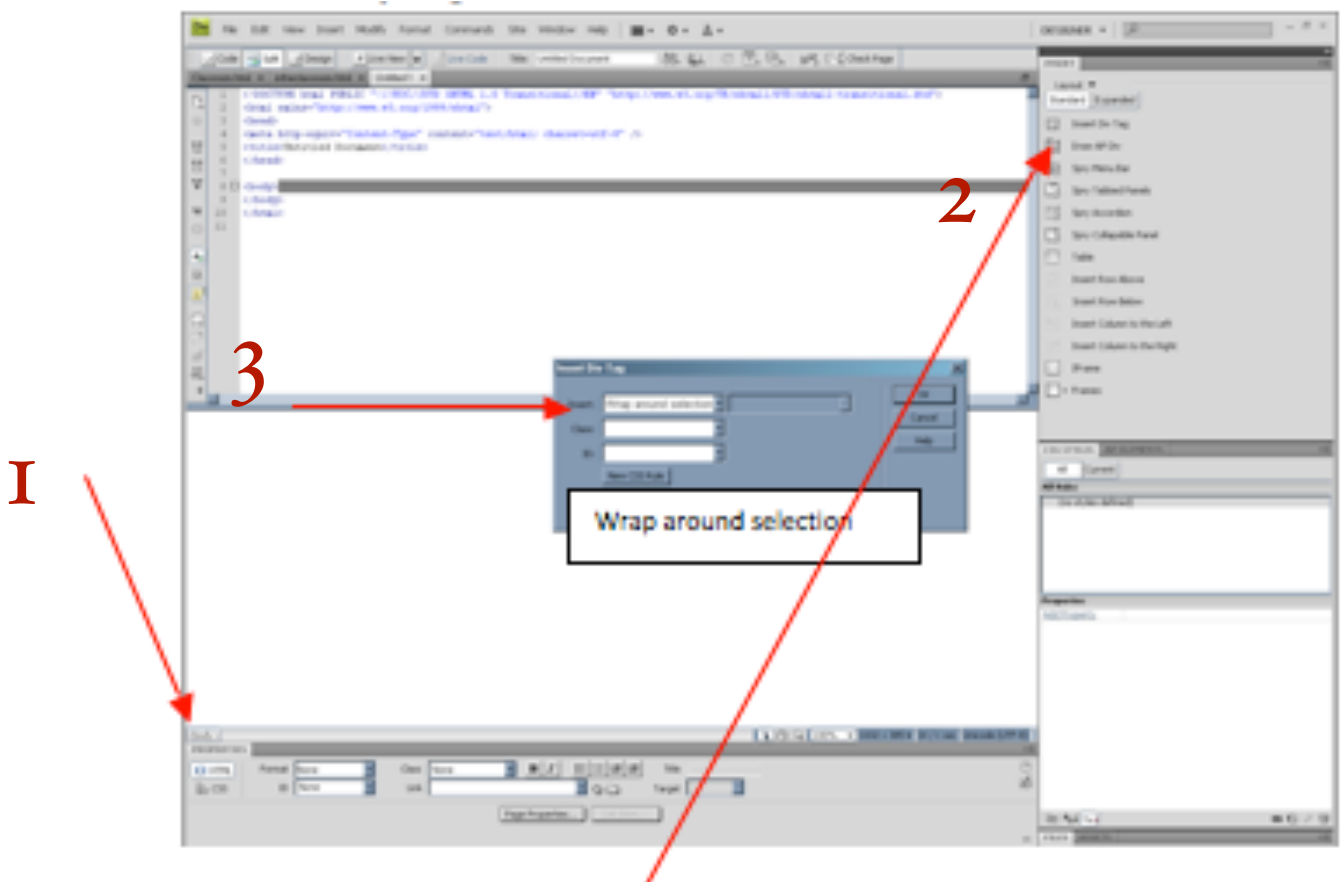

- Curtain/Body: This area is established with the <body> tag. You set up the preferences for the body tag in the page properties. The main attributes which are set up for the body tag are: background color and/or image (which is shown in the gray above), link color, default text color and size. Like a curtain it surrounds the stage/container
- Stage/Container: The container is established with “Insert Div Tag” and you name the div container (think of div as a box.) The entire site is made up of divs but the container div is the most important because all the other divs/boxes sit inside this div. In the end you have a result of <container> tag. There are certain rules which must be set up for the container for all the other divs/boxes to sit in the container correctly. Like a stage it is was all the accessories are placed on.
- Actors/Text & Images: These elements get placed inside the container/stage. Like actors they each have their own roles and rules.

# Creating the Container

## Section 2

### • Creating the Container

1. Select the body tag located on the bottom left hand corner of the screen (this will select the entire body for you)
2. In the layout panel (may say common but in the drop down menu choose layout) choose “insert div tag”. Because we are creating the most important div the container we “insert div tag” all future divs will be created using “draw ap div”
3. In the box which will pop up make sure in the insert section it automatically says “wrap around selection.” If this does not appear in that box cancel out the action and do it over again (you can not type or select this option.) This option will make the body wrap around the container just like a curtain wraps around a stage. **Also, in the id section type the word container (all lower case)**

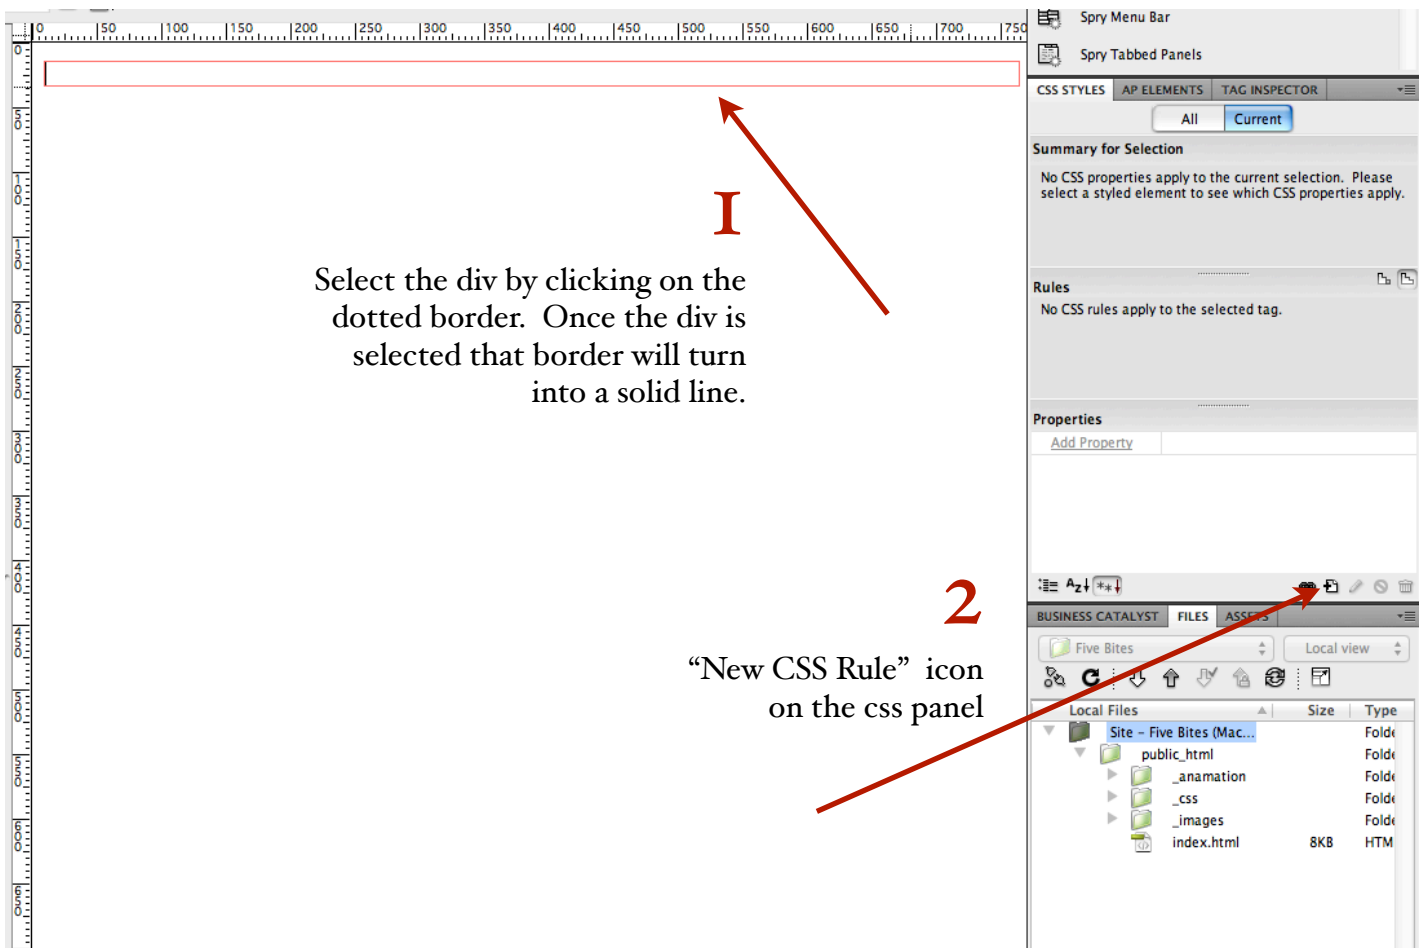

# Creating the Container

## Section 2

### • Creating the Container

4. Select the new div called container which now appears in the design section of the workspace. At this time this div also known as the container has no rules/style that is what we are going to be doing next.
5. Once you have selected the div click on the “new css rule” icon which is placed on the css panel.

# Creating the Container

## Section 2

### • Creating the Container

6. A window will pop up which will allow you to start creating the rules for the div which we named “container.” Since we are creating rules/styles for a div/box which we are currently selected on we call those rules compound. Choose compound from the drop down list under: choose a contextual selector type for your CSS rule. The selector name should be by default called #container. The # sign represents a div. If that section does not say #container start the process over - you can not type that text in that area. Finally, Choose where your rule will be defined: keep that as this document only. We choose this because we are going to create internal css which will apply to this document only. External CSS would apply to more than one page. --> Select Ok!

New CSS Rule

Selector Type:  
Choose a contextual selector type for your CSS rule.

Compound (based on your selection)

Selector Name:  
Choose or enter a name for your selector.

#container

This selector name will apply your rule to any HTML elements with id "container".

Less Specific More Specific

Rule Definition:  
Choose where your rule will be defined.

(This document only)

OK Cancel Help

# Creating the Container

## Section 2

### • Creating the Container

7. The rules which you must set up in this box are:

TAB	RULE
Background	Color or Image, your preference
Box	Wide= 1000 (800-1200) Height= 1000 (800-1200) Margin = right: auto, left: auto
Positioning	Relative

8. When you are done setting the rules hit “apply” and then “ok” and then your container has been created.

The screenshot shows the 'CSS Rule definition for #container' dialog box. The 'Category' list on the left has 'Box' selected. The 'Box' tab is active, showing the following settings:

- Width: 1000 px
- Height: 1000 px
- Float: (empty)
- Clear: (empty)
- Padding:  Same for all. Top, Right, Bottom, and Left are all set to (empty) px.
- Margin:  Same for all. Top: (empty) px, Right: auto, Bottom: (empty) px, Left: auto.

Buttons at the bottom include 'Help', 'Apply', 'Cancel', and 'OK'.

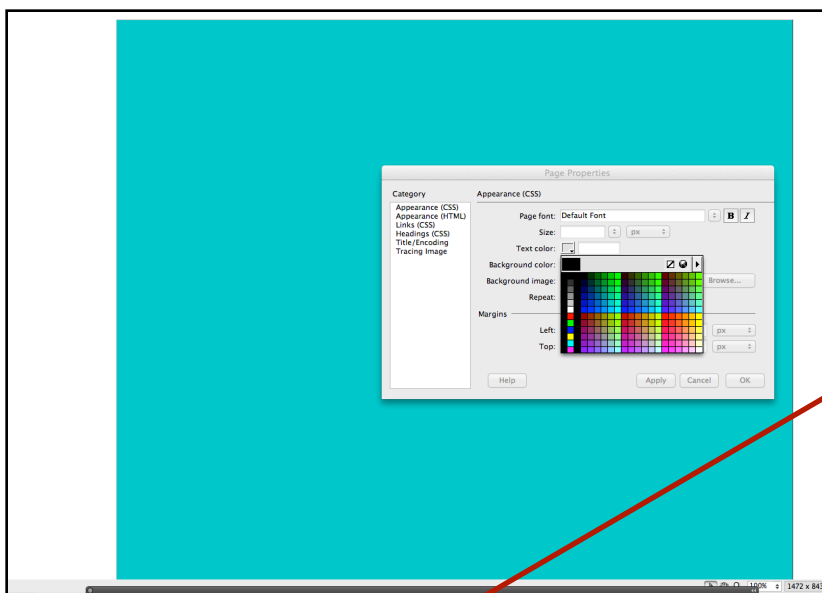

# Formatting the Body

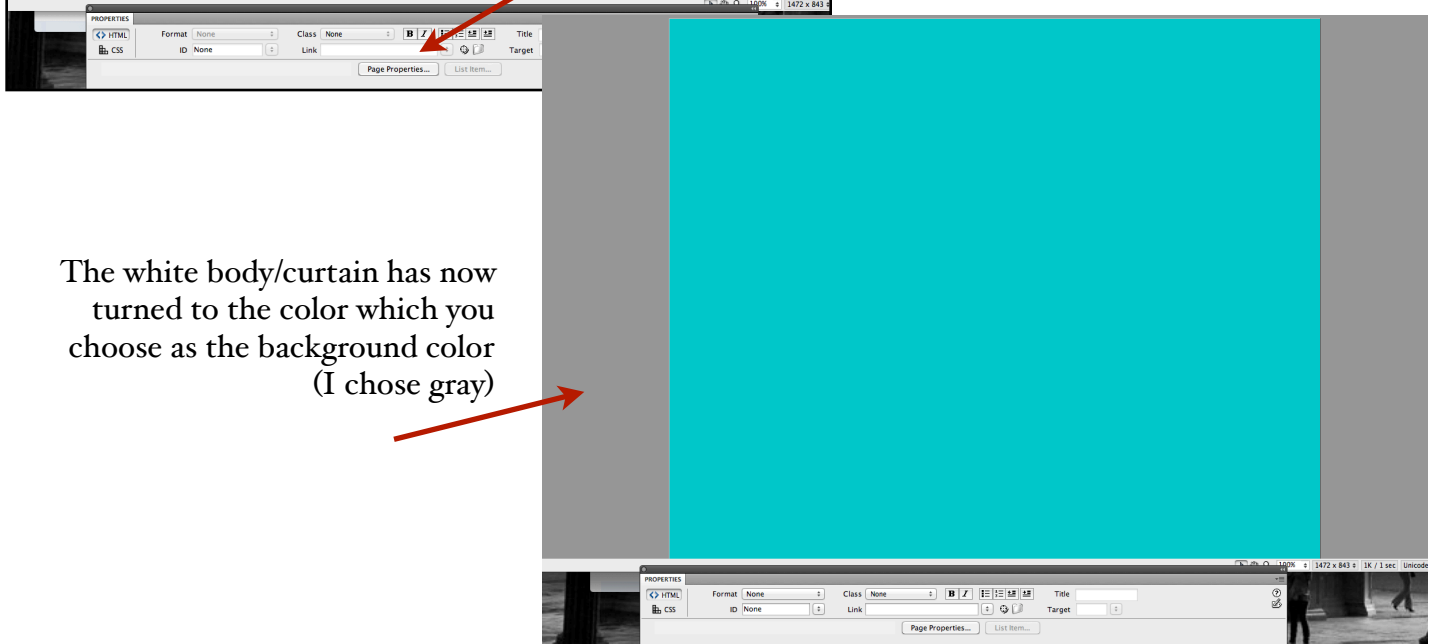

## Section 3

### • Customizing the Body Background (curtain)

1. Once you have the container/stage set up you probably want to spice up around the container/stage by formatting the body/curtain tag. You can do so by clicking on the “page properties” button on the properties panel.
2. Once in the page properties section click on Appearance (css) and choose your background color from the middle of the screen. Click “apply” and then “ok”

I  
Page Properties button located  
on the properties panel.

The white body/curtain has now  
turned to the color which you  
choose as the background color  
(I chose gray)

# Checking out the Code

## Section 4

### • HTML and CSS

---

- i. Before adding any more divs into the file check out the code which has been created from inserting the div and applying rules/css.

```
1 <!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Transitional//EN" "http://www.w
2 <html xmlns="http://www.w3.org/1999/xhtml">
3 <head>
4 <meta http-equiv="Content-Type" content="text/html; charset=UTF-8" />
5 <title>Untitled Document</title>
6 <style type="text/css">
7 #container {
8     background-color: #0CC;
9     height: 1000px;
10    width: 1000px;
11    margin-right: auto;
12    margin-left: auto;
13    position: relative;
14 }
15 body {
16     background-color: #999;
17 }
18 </style>
19 </head>
20
21 <body>|
22 <div id="container"> </div>
23 </body>
24 </html>
25
```

# Filling in the Container

## Section 5

### • Understanding What is Inside the Container

• The container is a div with the name “container.” A div is basically a box. Everything you place into an .html file in Dreamweaver should be placed in a box. The most important box on the page is the container and all other boxes/divs sit in the container. The container box is the only box that must follow a certain name and rules. All the other boxes/divs only need to follow one certain rule to work correctly and that is for them to be placed as absolute. A break down of the boxes/divs is featured below. The directions to fill in your container are posted on the following page.

The screenshot shows a website layout with several distinct sections, each enclosed in a blue border representing a div. At the top left is a large image of a diverse group of students. Below it is a smaller image of a woman pointing to a 'GPA+' logo. To the right of these images is a vertical stack of four green boxes containing the text 'GPA+', 'Biography', 'Content', and 'Testimonials'. Below the woman's image is a 'GPA+' logo with the tagline 'for academic success'. Further down is a text block with contact information for GPA+ Solutions, LLC, including a phone number and email address. To the right of the text is a photo of a man in a classroom. At the bottom right is a 'GOOGLE+ CERTIFIED' logo. A footer at the very bottom reads 'Site created by Mattick High School Web Design Team • Sam O'Brien • Mattick, Massachusetts'. Red and green arrows point from text annotations on the right to specific elements in the layout.

**The larger div/box is the container which sits on the body/curtain**

**Any element which is placed in the container is placed in a div/box so that the element can be picked up and moved.**

### **Page Breakdown**

Container: qty. = 1

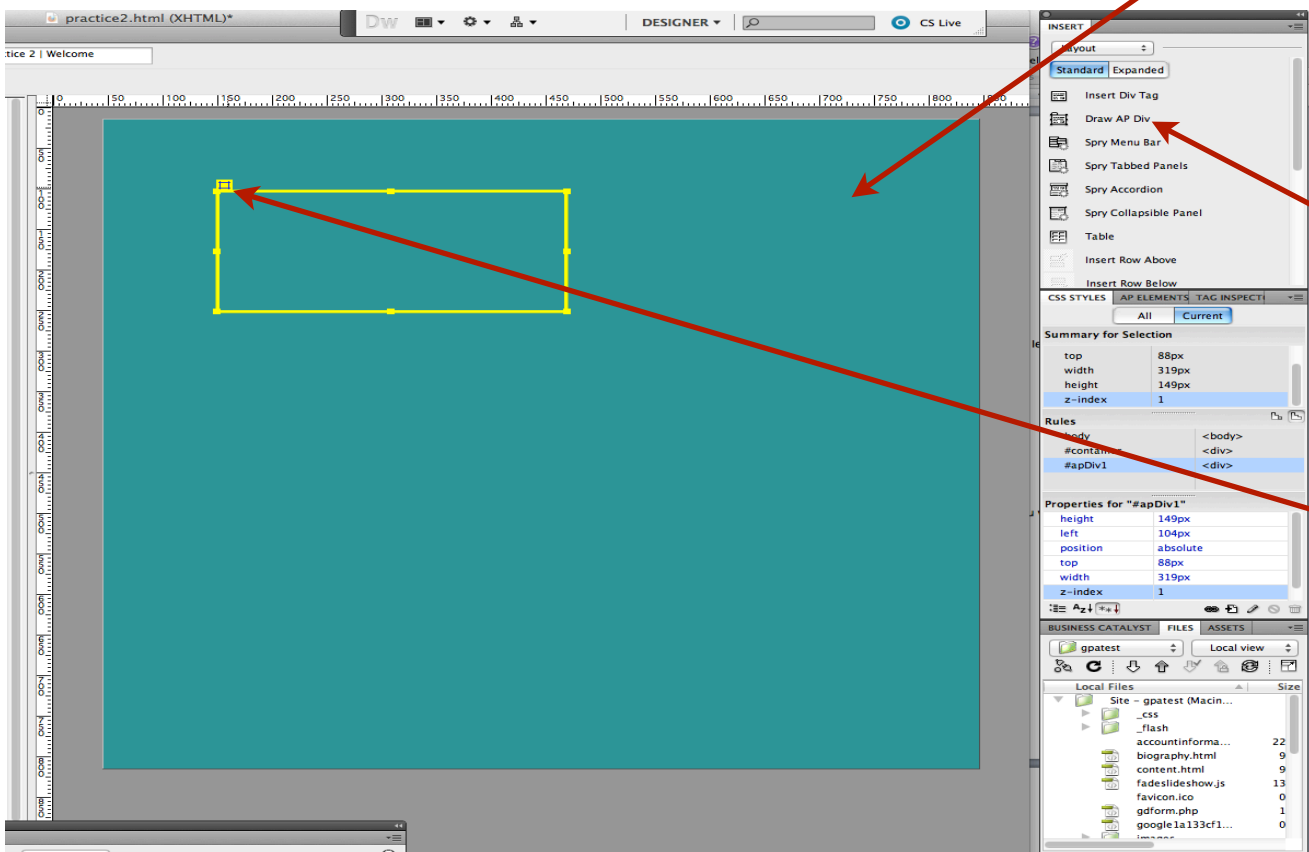

All other divs: qty. = 10

# Filling in the Container

## Section 5

### • Steps to Fill in the Container

1. In Design view click anywhere inside the container (you will not see anything happen)
2. In the Insert Panel (under layout) click on "Draw AP div." If you move your cursor back into the design area it will be a cross, click and drag the cursor to make a box. You can make the box/div any size because you can re-size it later.
3. Once the box is drawn select it by clicking on the small box in the top left hand corner of the box/div.

4. When the box is selected the properties panel at the bottom of the screen provides you with a box called CSS-P Element. In this box give your div/box a name. Name it something relative to what is being placed inside the div/box. The name must be all lowercase and no spaces. Hit enter once you are done typing in the name. **\*\*Important do not type the name in the ID space it must be typed in the CSS-P element space.**

# Filling in the Container

## Section 5

### • Steps to Fill in the Container

5. Now that the div/box has a name you need to provide it with rules/style, you do so by clicking on the “new the css rule” icon located on the css panel.

6. A new rule pop-up will appear. Set the rules up as shown below and then click “ok.”

#### Rule Breakdown:

- Rule type is compound: We are creating a rule for the box which we are currently selected on

- Name for your selector: #container #maintext. This information should automatically fill itself in and if it does not cancel the operation and start over again. To understand the name read it backwards, the maintext sits inside the container. The this box will follow the container rules and then the maintext rules.

- Rules to be defined: This document only, implies that the CSS will be placed internally (between the head tags) The other option is to place it externally which we will do when creating sites in the future.

The screenshot shows a web design application interface. A teal-colored container is visible on the left. A yellow rectangular selection box is drawn over a portion of the teal area. In the foreground, a 'New CSS Rule' dialog box is open. The 'Selector Type' is set to 'Compound (based on your selection)'. The 'Selector Name' is '#container #maintext'. The 'Rule Definition' is '(This document only)'. The 'OK' button is highlighted with a red arrow and the number 5. The 'Cancel' button is also visible. In the background, the CSS panel is visible, showing the rule being applied to the 'body' element. The 'OK' button is also highlighted with a red arrow and the number 6. The CSS panel shows the rule being applied to the 'body' element, with the selector name '#container #maintext' visible. The 'Properties for "body"' section shows the 'background-color' property set to '#999'. The 'Local Files' panel is visible at the bottom, showing a file structure for 'gptest'.

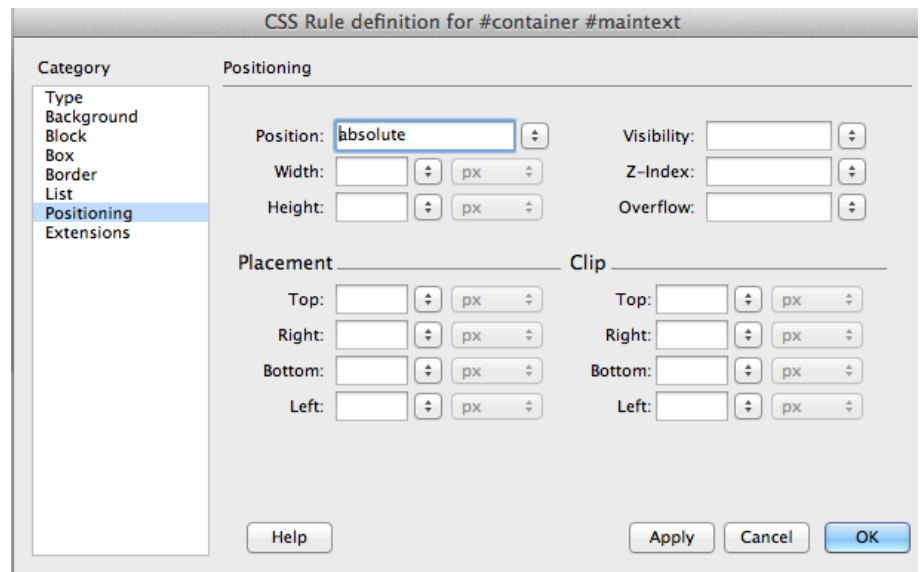

# Filling in the Container

## Section 5

### • Steps to Fill in the Container

7. When the rule box pops up the only rule you must set up for the box/div to function properly is: (and click “ok”)

TAB	RULE
Positioning	Absolute

- This rule makes the div/box sit absolutely where you tell it to be placed. This allows you to pick up the div/box and move it around the container.
- You may set up other rules for the div/box but it is not necessary (example: background color)

8. You now have a div/box which you can place anywhere inside the container. You can place text or an image inside this box. Enjoy!!!

# Filling in the Container

## Section 6

### • Understanding the Code

- Code reference: All the divs which sit in the container will be placed in between the container tag. What you name the div is what will appear in the code.

```
1 <!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Transitional//EN"
  "http://www.w3.org/TR/xhtml1/DTD/xhtml1-transitional.dtd">
2 <html xmlns="http://www.w3.org/1999/xhtml">
3 <head>
4 <meta http-equiv="Content-Type" content="text/html; charset=UTF-8" />
5 <title>Practice 2 | Welcome</title>
6 <style type="text/css">
7 #container {
8     background-color: #399;
9     height: 800px;
10    width: 800px;
11    margin-right: auto;
12    margin-left: auto;
13    position: relative;
14 }
15 body {
16     background-color: #999;
17 }
18 #maintext {
19     position: absolute;
20     left: 32px;
21     top: 130px;
22     width: 697px;
23     height: 162px;
24     z-index: 1;
25 }
26 #container #maintext {
27     position: absolute;
28 }
29 </style>
30 </head>
31
32 <body>
33 <div id="container">
34 <div id="maintext">Lorem ipsum dolor sit amet, consectetur adipiscing elit.
  Proin consectetur quam diam. Pellentesque habitant morbi tristique senectus
  et netus et malesuada fames ac turpis egestas. Morbi quis mi risus, placerat
  volutpat elit. Nunc tempor consequat augue in viverra. Maecenas fringilla,
  nulla ut porttitor ultrices, odio eros blandit nunc, non auctor magna libero
  nec dolor. Integer eu leo risus. Etiam rutrum sem a quam bibendum eget
  laoreet mauris blandit. Cras commodo ipsum vel tellus ultrices
  bibendum. Integer lorem dui, imperdiet quis scelerisque quis, vehicula eget
  libero.</div>
35 </div>
36 </body>
37 </html>
```

- In this picture I created the div/box called “maintext”
- **Notice:** The rules set up for “maintext” in lines 18-24. The most important rule is position: absolute. The other rules set themselves up as you place the box where you need it on the page.
- **Notice:** That in the body section the div “maintext” sits between the open and close body tag and open and close container tag.

# Formatting Text

## Section 6

### • The Options

• Fours basic ways in which you can format text are:

1. Default Font, `<p></p>`
2. Headings, `<h1></h1>`
3. Link, `<a href...>`
4. Class, `<class="classname"...>`

You can format each one in your own way. Below you will see an example of each tag.

The image shows a web page layout with several text formatting examples. Red arrows point from labels on the right to specific elements on the page:

- Heading 1 tag:** Points to the main title "All About Amy" at the top of the page.
- Link:** Points to the "Design" link in the navigation menu.
- Heading 2 tag:** Points to the sub-header "All About Amy" in the main content area.
- Link again:** Points to the "adobetv.com" link in the "Favorites" sidebar.
- Default Font, <p>:** Points to the first paragraph of Lorem Ipsum text in the main content area.
- Class:** Points to the sentence "The best part about formatting is creating your own class!" which is highlighted with a yellow border.

At the bottom of the page, there is a footer: "Natick High Web Design • Amy Smith • Natick, MA".

# Formatting Text

## Section 6

### • Default Font

• The default font in Dreamweaver is the font which appears as paragraph text. Anything in between `<p>` and `</p>`. If you do not format the default font in Dreamweaver it will automatically be Times New Roman 12 or whatever you have it set up to be in the Dreamweaver preferences.

• To Format the Default Font

1. Click on “Page Properties” on the properties panel at the bottom of the screen
2. Be selected in “Appearance (CSS)” on the left hand side. This will make it so that any rules you set up through Page Properties will be written into the file as CSS.
3. Set up all the default properties as shown below (font type, size, color.) Click “ok”

The screenshot shows the Dreamweaver interface. At the top, a yellow header bar contains the text "All About Amy" and four navigation links: "Home", "Leadership", "Hobbies", and "Design". Below the header is a main content area with a blue background. It features a large heading "All About Amy" in pink, a placeholder for a "Picture of me playing soccer", and several paragraphs of placeholder text. A red arrow points from the text "Default Font, <p>" to a paragraph of placeholder text in the main content area. In the foreground, the "Page Properties" dialog box is open, showing the "Appearance (CSS)" category. The settings are: Page font: Arial, Helvetica, sans-serif; Size: 12 px; Text color: #F06; Background color: #999. The "PROPERTIES" panel at the bottom shows the "Format" set to "None", "Class" set to "linkboxes", and "ID" set to "middletext".

- **Notice:** The rules I set up for default text: type = Arial, size = 12, color = #F06

- **Notice:** Three types are listed as one option because the browser will look for the first font type listed and if it is not familiar with that font it will jump to the second option and then third.

- **Notice:** They cut the hex code down to three digits. Example: #F06 is really #FF0066

# Formatting Text

## Section 6

### • Headings

• Headings help search engines index your site and format important content. There are six headings. Heading 1 is considered the important and heading 6 is considered least important. I usually set up three headings. By default the heading font is black and the same font type as the default font type (Times New Roman) and heading 1 is always set to be the largest.

#### • To Format the Heading

1. Click on “Page Properties” on the properties panel at the bottom of the screen
2. Be selected in “Heading (CSS)” on the left hand side. This will make it so that any rules you set up for the heading tags will be written into the file as CSS.
3. You can set up the headings to your preference. Just keep in mind that heading 1 should always be the largest. Click “ok.”
4. Highlight the text you want to be heading 1 and choose heading 1 from the format menu on the properties panel.

Heading, <h1>

Heading, <h2>

Apply the tag to the text here

- **Notice:** The rules I set up for the headings: each tag rule can be completely difference from each other
- **Notice:** Three types are listed as one option because the browser will look for the first font type listed and if it is not familiar with that font it will jump to the second option and then third.
- **Notice:** They cut the hex code down to three digits. Example: #F06 is really #FF0066

# Formatting Text

## Section 6

### • Links

• Text links can be set up to external sites or other files within the site. Depending on your Dreamweaver preferences by default links are usually the same font type as the default font, the color is blue and they are underlined.

#### • To Format Links

1. Click on “Page Properties” on the properties panel at the bottom of the screen
2. Be selected in “Link (CSS)” on the left hand side. This will make it so that any rules you set up for the heading tags will be written into the file as CSS.
3. You can set up the links to your preference. Notice you have different states of the link which you can set up. Click “ok”
4. Highlight the text you want to be a link and type in the link destination in the link box located in the properties panel (in the address for an external link you must include <http://www...>)

Link, <a href=>

Apply the link destination here

- **Notice:** If you want to apply different link rules to different sections of the page you can do so but it is not shown in this tutorial. (Adv. Text Link Tutorial: <http://mynoteztoself.blogspot.com/p/dreamweaver.html> )
- **Notice:** Three types are listed as one option because the browser will look for the first font type listed and if it is not familiar with that font it will jump to the second option and then third.
- **Notice:** They cut the hex code down to three digits. Example: #F06 is really #FF0066

# Formatting Text

## Section 6

### • Class

• Creating a class in Dreamweaver allows you to create any rule and apply it to any element. With text you can name the rule any thing you want and provide any font rules.

#### • To Format Links

1. Click on the “New CSS Rule” icon on the CSS panel at the right of the screen
2. In the pop up window, Choose the following...Rule type= Class and then type in the any name you would like to give this rule, apply this rule to this document only (for internal CSS). When naming the rule no spaces or capital are allowed. Click “ok”
3. Apply any rules you want this class to follow. Example: I made it so this rule turns my text green. (In step two I named my rule, “greentext”, get it)?
4. Highlight the text you want to apply this rule and choose the rule name from the class list in the “Properties Panel.”

The screenshot shows the Adobe Dreamweaver interface with several panels and dialog boxes. A red arrow points from the 'New CSS Rule' icon in the CSS panel to the 'New CSS Rule' dialog box. Another red arrow points from the 'Class' dropdown in the Properties panel to the 'greentext' class name in the dialog box. A third red arrow points from the 'Type' dropdown in the 'CSS Rule definition for .greentext' dialog to the 'Class' dropdown in the Properties panel. A fourth red arrow points from the 'Class' dropdown in the Properties panel to the highlighted text 'Amy' in the document. The 'New CSS Rule' dialog box shows 'Class (can apply to any HTML element)' selected as the selector type, and 'greentext' entered as the selector name. The 'CSS Rule definition for .greentext' dialog box shows 'Type' selected as the rule type, and 'Color' set to '#00FF00'. The Properties panel shows the 'Class' dropdown set to 'linkboxes'.

1 Create New CSS Rule

2 - Class  
- Name the rule!  
- This document only (internal CSS)

3 Set up the rules you want to apply

4 Highlight the text you want to change and choose the rule name from the Class drop down list.

- **Notice:** You can apply more than rule to a class. I can tell the text to be green and bold!
- **Notice:** Three types are listed as one option because the browser will look for the first font type listed and if it is not familiar with that font it will jump to the second option and then third.
- **Notice:** They cut the hex code down to three digits. Example: #F06 is really #FF0066
