

Bootstrap Steps:

1. Create root folder on desktop
2. Go to getbootstrap.com
3. Click on the "Download Bootstrap" on the home page in purple
4. Then click on "Download Bootstrap" again (the one on the far left)
5. unzip folder and set up so that it follows regular root folder structure
6. Start an html file
7. Go back to bootstrap and scroll down to examples (she uses the bootstrap blog)
8. Paste that "page source" code into your html file
9. Save file as "index.html" in root folder and you will notice that it is not formatted
10. Now make roots to document as clear as possible (example: remove ../)
11. Need to grab blog.css yourself from the page source
12. All set, but a challenge is the CSS is very specific

Adding Individual Features:

1. Take the code from the head section and body section
2. Copy over the css, js and fonts folder
3. Copy and paste the lines of code provided for each individual feature from bootstrap
(example: for search icon, ``)
